Assignment 9 + Word Sense Disambiguation (SNLP Tutorial 10)

Vilém Zouhar, Awantee Deshpande, Julius Steuer

29th June, 1st July

Assignment 9

- Exercise 1: Feature Engineering, Classification
- Bonus: Support Vector Machines

Word Sense Disambiguation

Apple is full of vitamins.

Apple was struggling last quarter.

Apple was thrown away from the meeting.

$$f(w, C) = s \in S_w$$

 $f(Apple, * was thrown away from the meeting) $\in \{fruit, company\}$$

Word Sense Disambiguation

Machine translation:

- Apfel ist voller Vitamine.
- Apple ist voller Vitamine.
- Apfel hatte im letzten Quartal Probleme.
- Apple hatte im letzten Quartal Probleme.

Information retrieval:

- Query: Apple vitamins
- Relevant document: benefits of eating apples

Dialogue systems

Spelling correction

One sense per . . .

One sense per discourse

One meaning per word+document

One sense per collocation

Nearby words help determine the sense

Dictionary

- Dictionary/Thesaurus: $\forall w, s \in S_w : D(s) = \text{description of sense } s$
- Context: $\forall w, C(w) = \text{context of word } w \text{ in a specific occurence}$

Lesk's Algorithm

• Idea: Sense s_i of ambiguous word w is likely to be the correct sense if many of the words used in the dictionary definition of s_i are also used in the definitions of words in the ambiguous word's context.

$$s_{opt} = \operatorname*{argmax}\limits_{s_k} sim\left(D(s_k), \bigcup_{v_j \in C} E(v_j)\right)$$

Similarity

$$\frac{2|X \cap Y|}{|X| + |Y|} \qquad \frac{2|X \cap Y|}{|X \cup Y|} \qquad \frac{|X \cap Y|}{\sqrt{|X| \cdot |Y|}}$$

Advantages? Disadvantages?

Simplified Lesk's Algorithm Example

Sentence: The *bank* can guarantee deposits will eventually cover future tuition costs because it invests in adjustable-rate mortgage securities.

Senses

- bank¹ Gloss/Defⁿ: a financial institution that accepts deposits and channels the money into lending activities.
 - e.g.: "She cashed a cheque at the bank".
- bank² Gloss/Defⁿ: sloping land (especially the slope beside a body of water). e.g.: "They had a picnic on the river bank".

```
from nltk.corpus import senseval
hard, interest, line, serve = senseval.fileids()
line_instances = senseval.instances(line)
```

• Improvements include weighting by measures like IDF

Supervised Disambiguation

Bayes Decision

$$\hat{s} = \arg \max_{s} p(s|C) = \arg \max_{s} \frac{p(C|s) \cdot (p(s))}{p(C)}$$
$$= \arg \max_{s} p(C|s) \cdot (p(s))$$

Naïve Bayes

$$p(C|s) = \prod_{x \in C} p(x|s)$$

- Estimate by MLE counts (+ smoothing)
- Independence within context
- Position in context does not matter
- What kind of feature vectors can exist?
- Advantages? Disadvantages?

Supervised Disambiguation Features Example

Sentence: Transactions on a deposit account of the bank are recorded in books, and the resulting balance is recorded as its liability.

Collocational features:

$$[w_{i-3}, POS_{i-3}, w_{i-2}, POS_{i-2}..., w_{i+3}, POS_{i+3}]$$
 [account, NN, of, PP, the, DT, ...] $[w_{i-2}, w_{i-1}, w_{i+1}]$

Bag of Word Features
 Let V : {institution, account, water, land}
 Vector: [0, 1, 0, 0] for given sentence

Unsupervised Disambiguation

- Machine translation is able to choose the right sense
 (assuming different senses have different translations) <!-» MT is trained on
 unsupervised data ->
- Apple was struggling last quarter.
 Apple hatte im letzten Quartal Probleme.
- Apple is full of vitamins.
 Apfel ist voller Vitamine.
- Translations (in German): {Apfel, Äpfel, Apple}
- Indicator words: {struggling, quarter, full, vitamins} (stopwords removed)

Partition translated words ($\{Q_1, Q_2\}$) and indicator words ($\{P_1, P_2\}$) to maximize:

$$I(P; Q) = \sum_{i \in Q, t \in P} \log \frac{p(i,t)}{p(i) \cdot p(t)}$$

Flip-Flop Algorithm

- **1** find random partition $P = \{P_1, P_2\}$ of $t_1, ..., t_m$
- while improving I(P;Q) do
- find partition $Q = \{Q_1, Q_2\}$ of $x_1, ..., x_n$ that maximises I(P;Q)
- find partition $P = \{P_1, P_2\}$ of $t_1, ..., t_m$ that maximises I(P;Q)
- end
- t_i: translations of the ambiguous word
- \bullet x_i : indicator words
- I(P;Q) monotonically increases until convergence
- Disambiguation Determine x_i

if $x_i \in Q_1$ assign sense 1

if $x_i \in Q_2$ assign sense 2

EM Algorithm

- Idea: Random initialisation followed by parameter estimation
- Paramaters? $P(v_j|s_k)$ and $P(s_k)$
- Maximise log-likelihood $\log \prod_i \sum_k P(c_i|s_k)P(s_k)$
- E step: $h_{ik} = \frac{P(c_i|s_k)P(s_k)}{\sum_l P(c_i|s_l)P(s_l)}$
- M step: $P(v_j|s_k) = \frac{\sum_i C(v_j \in c_i) \cdot h_{ik}}{\sum_j \sum_i C(v_j \in c_i) \cdot h_{ik}}$

$$P(s_k) = \frac{\sum_i h_{ik}}{\sum_k \sum_i h_{ik}}$$

• Disambiguation: $s_{opt} = argmax_{s_k} [\log P(s_k) + \sum_{v_j \in C} \log P(v_j | S_k)]$

Yarowsky Algorithm

- Utilises one sense per discourse and one sense per collocation
- Algorithm:
- In a large corpus, identify all examples of a polysemous word, and store their contexts as an untagged training set.

e.g.

The company *plant* is still operational...

The region abounts in plant life...

The classification of plant and animal kingdoms. . .

- ② For each sense of the word $(s_1...s_k)$, identify collocations representative of the sense, and tag all the sentences from (1) which contain the seed collocation with the respective label. e.g.
 - Sense 1: The company plant is still operational
 - Sense 2: The region abounds in *plant* life. . .
 - Sense 2: The classification of plant and animal kingdoms

Yarowsky Algorithm

- Train on the seed sets (Sense 1, Sense 2).
 - Apply the obtained classifier on the entire sample set. Only retain those tags that are above a certain probability threshold. Add these examples to the seed set.
 - Use one sense per discourse to augment and correct the available data.

e.g.

Sense 1: The company plant is still operational

? \rightarrow Sense 1: The *plant* was shut down due to inflation.

- Repeat (3a) to (3c)
- ullet Hold training parameters constant, and the algorithm will converge on the residual set.
- Apply the classifier to new data or original untagged data.
