- "Cheating" allowed

Assignment 5

- Exercise 1: OOV Words
- Exercise 2: Additive smoothing
- Exercise 3: Perplexity, infinite smoothing, interpolation
- Bonus: Other language models

Cross-validation is . . .

- Cross-validation is . . .
- Train/(valid,test) split

- Cross-validation is . . .
- Train/(valid,test) split
- K-fold cross-validation is . . .

- Cross-validation is . . .
- Train/(valid,test) split
- K-fold cross-validation is . . .
- Divide data into k subsets, train on k-1 subsets and test on the remaining 1.

- Cross-validation is . . .
- Train/(valid,test) split
- K-fold cross-validation is . . .
- Divide data into k subsets, train on k-1 subsets and test on the remaining 1.
- Leave One Out cross-validation is . . .

- Cross-validation is . . .
- Train/(valid,test) split
- K-fold cross-validation is . . .
- Divide data into k subsets, train on k-1 subsets and test on the remaining 1.
- Leave One Out cross-validation is . . .
- N-fold cross-validation (use one point for testing)

- Cross-validation is . . .
- Train/(valid,test) split
- K-fold cross-validation is . . .
- Divide data into k subsets, train on k-1 subsets and test on the remaining 1.
- Leave One Out cross-validation is . . .
- N-fold cross-validation (use one point for testing)

- Cross-validation is . . .
- Train/(valid,test) split
- K-fold cross-validation is . . .
- Divide data into k subsets, train on k-1 subsets and test on the remaining 1.
- Leave One Out cross-validation is . . .
- N-fold cross-validation (use one point for testing)

Questions

• What is the motivation behind LOOCV?

- Cross-validation is . . .
- Train/(valid,test) split
- K-fold cross-validation is . . .
- Divide data into k subsets, train on k-1 subsets and test on the remaining 1.
- Leave One Out cross-validation is . . .
- N-fold cross-validation (use one point for testing)

- What is the motivation behind LOOCV?
- What is the main issue of LOOCV?

- Cross-validation is . . .
- Train/(valid,test) split
- K-fold cross-validation is . . .
- Divide data into k subsets, train on k-1 subsets and test on the remaining 1.
- Leave One Out cross-validation is . . .
- N-fold cross-validation (use one point for testing)

- What is the motivation behind LOOCV?
- What is the main issue of LOOCV?
- Why is k-fold cross-validation better than cross-validation?

- Cross-validation is . . .
- Train/(valid,test) split
- K-fold cross-validation is . . .
- Divide data into k subsets, train on k-1 subsets and test on the remaining 1.
- Leave One Out cross-validation is . . .
- N-fold cross-validation (use one point for testing)

- What is the motivation behind LOOCV?
- What is the main issue of LOOCV?
- Why is k-fold cross-validation better than cross-validation?
- Why is cross-validation better than k-fold cross-validation?

- Cross-validation is . . .
- Train/(valid,test) split
- K-fold cross-validation is . . .
- Divide data into k subsets, train on k-1 subsets and test on the remaining 1.
- Leave One Out cross-validation is . . .
- N-fold cross-validation (use one point for testing)

- What is the motivation behind LOOCV?
- What is the main issue of LOOCV?
- Why is k-fold cross-validation better than cross-validation?
- Why is cross-validation better than k-fold cross-validation?
- How does shuffling the dataset affect the LOOV score?

- Cross-validation is . . .
- Train/(valid,test) split
- K-fold cross-validation is . . .
- Divide data into k subsets, train on k-1 subsets and test on the remaining 1.
- Leave One Out cross-validation is . . .
- N-fold cross-validation (use one point for testing)

- What is the motivation behind LOOCV?
- What is the main issue of LOOCV?
- Why is k-fold cross-validation better than cross-validation?
- Why is cross-validation better than k-fold cross-validation?
- How does shuffling the dataset affect the LOOV score?
- If two models have same average performance (k-fold cross-validation), are they the same?

- Cross-validation is . . .
- Train/(valid,test) split
- K-fold cross-validation is . . .
- Divide data into k subsets, train on k-1 subsets and test on the remaining 1.
- Leave One Out cross-validation is . . .
- N-fold cross-validation (use one point for testing)

- What is the motivation behind LOOCV?
- What is the main issue of LOOCV?
- Why is k-fold cross-validation better than cross-validation?
- Why is cross-validation better than k-fold cross-validation?
- How does shuffling the dataset affect the LOOV score?
- If two models have same average performance (k-fold cross-validation), are they the same?
- Other usage of k-fold cross-validation (or split in general)?

Smoothing Techniques - Basics

- To keep a language model from assigning 0 or ~0 probabilities to _____
- Generally we can smooth any arbitrary
- Different ways to do this...

Floor Discounting

$$P(w|h) = \frac{N(w,h) + \epsilon}{N(h) + \epsilon \cdot V}$$

Variants: Laplace smoothing, Lidstone smoothing, add- α smoothing. . .

- What is N(h) for unigram N(w)?
- What is N(h) for n-gram N(w, h)?
- What is N(h) for zerogram?

Data: 🍎 💆 🍆 🍛 🤌 🖧 🍆 💥 🎉

- $N_4 = \{ \nearrow \}$
- $N_3 = \{ , \}$
- $N_2 = \{ \}$
- $N_1 = \{ *, * \}$
- $N_0 = \{ \red{9} \}$

Data: 🔴 🐞 📞 🌭 🤌 🚨 🌭 💥 🎉

- $N_4 = \{ \nearrow \}$
- $N_3 = \{ , \}$
- $N_2 = \{ \}$
- $N_1 = \{ \mathbf{a}, \mathbf{a} \}$
- $N_0 = \{ \$ \}$

$$p_r = \frac{(r+1)N_{r+1}}{N_r} \cdot \frac{1}{N}$$

Data: 🍏 🐞 📞 🌭 🎉 🌭 🎉 🎉

•
$$N_4 = \{ \nearrow \}$$

•
$$N_3 = \{ , \}$$

•
$$N_2 = \{ \stackrel{\bullet}{\bullet} \}$$

•
$$N_1 = \{ \&, \& \}$$

•
$$N_0 = \{ \$ \}$$

$$p_r = \frac{(r+1)N_{r+1}}{N_r} \cdot \frac{1}{N}$$

- Nominator: expected total number of occurrences of words that occur r+1 times
- Denominator-left: previous bucket size
- Fraction-left: expected number of occurences of a single word from that bucket
- Denominator-right: divide by total occurences

• Two items have same original frequency. What will be their new probability?

- Two items have same original frequency. What will be their new probability?
- Let *k* be the maximum occurrence of a word. What's the issue?

- Two items have same original frequency. What will be their new probability?
- Let k be the maximum occurrence of a word. What's the issue?
- A similar issue related to the one above?

- Two items have same original frequency. What will be their new probability?
- Let k be the maximum occurrence of a word. What's the issue?
- A similar issue related to the one above?
- Do the probabilities sum up to 1?

- Two items have same original frequency. What will be their new probability?
- Let k be the maximum occurrence of a word. What's the issue?
- A similar issue related to the one above?
- Do the probabilities sum up to 1?
- How to make it work for anything above unigrams?

Linear Intepolation/Jelinek-Mercer Smoothing

Train: 🍏 🍒 🏄 🤌

Train bigrams: $(\overset{\bullet}{\bullet},\overset{\bullet}{\bullet})$ $(\overset{\bullet}{\bullet},\overset{\checkmark}{\diamond})$ $(\overset{\checkmark}{\diamond},\overset{\checkmark}{\diamond})$

Test: 🍒 🍏 🍒

Linear Intepolation/Jelinek-Mercer Smoothing

Train: 🍎 🍒 🤌 🤌

Train bigrams: $(\overset{\bullet}{\bullet},\overset{\bullet}{\bullet})$ $(\overset{\bullet}{\bullet},\overset{\checkmark}{\diamond})$ $(\overset{\checkmark}{\diamond},\overset{\checkmark}{\diamond})$

Test: 🍒 🝏 🍒

$$P(w|h) = \lambda P(w|h) + (1 - \lambda)P(w)$$

Can be generalised to higher order n-grams.

- What condition must be fulfilled for higher n-grams?
- How is λ_i determined?
- Can you smooth the above probabilities?

Backing-Off models

- What other way can we use the lower-order n-gram distributions?
- Is a lot of context always a good thing?
- Idea behind back-off models: Use information from a lower order n-gram distribution.

$$P(w|h) = \begin{cases} \frac{N(w,h)}{N(h)} + \alpha(h)\beta(w|h) & \text{for N(w,h)} > 0\\ \alpha(h)\beta(w|h) & \text{otherwise} \end{cases}$$

• How come the coefficient is a function of the history and not a fixed constant?

Distribution

- Vocabulary counts
- 🍎 6 🤌 5 🍆 3 🝒 2 🚇 0 🍫 0
 - ullet Decrease all non-zero counts by some parameter d = 0.75
- **ⓑ** 6-0.75 ≥ 5-0.75 **ो** 3-0.75 **ो** 2-0.75 **○** 0
 - Divide by N = 16
- **○** 0.33 **○** 0.26 **○** 0.14 **○** 0.11 **○** 0 **○** 0

Sum = $0.33+0.26+0.14+0.11 = 0.84 \neq 1$.

Idea: Utilise this probability mass for zero counts.

$$P(w|h) = \frac{c(w,h) - d}{c(h)}$$

Adjust the probability mass $1 - \sum_h \frac{c(w,h) - d}{c(h)}$

$$P(w|h) = \frac{c(w,h) - d}{c(h)}$$

Adjust the probability mass $1 - \sum_h \frac{c(w,h) - d}{c(h)}$

e.g. For bigrams,

$$\begin{split} P_{abs}(w_i|w_{i-1}) &= \frac{max\{N(w_{i-1},w_i) - d, 0\}}{\sum_{w'} N(w_{i-1},w')} + \lambda(w_{i-1})P_{abs}(w_i) \\ P_{abs}(w_i) &= \frac{max\{N(w_i) - d, 0\}}{\sum_{w'} N(w')} + \lambda(.)P_{unif}(w_i) \\ \text{where } \lambda(w_{i-1}) &= \frac{d}{\sum_{w'} N(w_{i-1},w')} \cdot N_{1+}(w_{i-1},\bullet) \\ \lambda(.) &= \frac{d}{\sum_{w'} N(w')} \cdot N_{1+} \end{split}$$

Absolute Discounting - Questions

- How does the discounting parameter *d* affect perplexity?
- What values can d take? Why?
- What if we set d to ∞ ?

Idea: Can we use the lower order distributions in a better way?

I WENT TO THE GROCERY ______.

Options:

 W_1 : STORE

*W*₂: YORK

Idea: Can we use the lower order distributions in a better way?

I WENT TO THE GROCERY ______.

Options:

 W_1 : STORE

*W*₂: YORK

Use the fact that YORK generally appears as context or *continuation* of the word NEW.

How likely is the word w?

How likely is the word w as a continuation?

$$P_{continuation}(w) \propto |\{w': C(w', w) > 0\}|$$

Normalize by all bigram types. : $|\{(w_i, w_j) : C(w_i, w_j) > 0\}|$

$$P_{KN}(w_i|w_{i-n+1:i-1}) = \frac{\max\{C_{KN}(w_{i-n+1:i-1},w_i) - d,0\}}{\sum_{w'} C_{KN}(w_{i-n+1:i-1}w')} + \lambda(w_{i-1})P_{continuation}(w_i)$$

$$where C_{KN}(\bullet) = \begin{cases} count(\bullet) & \text{for highest order} \\ continuation_count(\bullet) & \text{for lower orders} \end{cases}$$
 (1)

Will be covered in detail in the next tutorial...

Pruning

• Back-off models and interpolation save n-grams of all orders.

We are storing all $V^n + V^{n-1} + ... + V + 1$ distributions!

Pruning

Back-off models and interpolation save n-grams of all orders.

We are storing all $V^n + V^{n-1} + ... + V + 1$ distributions!

- Idea: Store the counts which exceed a threshold $c(\bullet) > K$. Also called a "cut-off".
- Idea: Use some information-theory based approach to determine the nature of the probabilities, and then prune the lower orders. Known as *Stolcke Pruning*.

Pruning

• Back-off models and interpolation save n-grams of all orders.

We are storing all $V^n + V^{n-1} + ... + V + 1$ distributions!

- Idea: Store the counts which exceed a threshold $c(\bullet) > K$. Also called a "cut-off".
- Idea: Use some information-theory based approach to determine the nature of the probabilities, and then prune the lower orders. Known as *Stolcke Pruning*.

- Does pruning assign 0 probability to the pruned n-grams?
- Can we prune an entire branch/subtree? What does this mean?
- What is a good pruning strategy?

Assignment 6

- Exercise 1: MAP and MLE estimates
- Exercise 2: Good Turing Smoothing
- Exercise 3: Cross-Validation
